This checklist is automatically generated using Version 3.0 of the online database CDF Galapagos Species Checklist.

Arachnids are invertebrates with eight legs, the front pair of legs in some species is sometimes converted to sensory organs. Almost all arachnids are terrestrial. However, some inhabit freshwater environments and, with the exception of the pelagic zone, marine environments as well. Spiders are today the best studied group of the Galapagos Arachnida. At the moment, 149 spider species are known, with 121 likely described as new. The remaining 28 species have yet to be identified to the species level and are probably new to science. Of the 124 identified species, 64 (almost 50%) are known only from the archipelago and hence may be endemic. 35 species have a New World distribution, 16 are cosmopolitan species, 6 pantropical, and 3 are cosmotropical species.

For marine species distribution data cited in the CDF Galapagos Checklists refer to the five main bioregions of the archipelago (Far Northern, Northern, Western, South Eastern and the Elithabeth Bay Bioregion). For the terrestrial species the more than 120 islands, islets and small rocks have been aggregated into Islands Groups, thus, for example, the island group "Santa Cruz" includes smaller islands like Santa Fé, Plaza Norte, Plaza Sur, Baltra, Daphne Mayor, Daphne Minor, and others.

Please be aware that the distribution data presented here is automatically generated from specimen records and does not always accurately reflect the known distribution for all species.

IUCN red-list assessments presented here may deviate from the global IUCN list for the following reasons:

- for well known species groups like vascular plants or vertebrates updates proposed to the IUCN are shown instead of the outdated, but currently accepted status;
- for poorly known species groups (e.g., lichenized fungi) a general assessment is currently not possible and the list presented here is a regional red-list list for Galapagos archipelago.

Names of taxa included in this checklist: 392 (323 Accepted , 48 Unidentified Taxon , 21 Doubtful).

Origin of the taxa included: 5 Accidental, 24 Questionable Accidental, 107 Endemic, 2 Indigenous, 3 Questionable Endemic.
