This checklist is automatically generated using Version 3.0 of the online database CDF Galapagos Species Checklist.

The **Lepidoptera** include two large groups of insects: moths and butterflies. They are undoubtedly one of the most popular insect orders, especially the large and colorful butterflies.

Many species are of economic interest, a famous example is the silk moth. Its larvae feed on mulberry leaves and build cocoons of some of the finest fibre known to man.

Lepidoptera are important pollinators, with many night blooming flowers requiring pollination by moths. All Lepidoptera have a body and wings covered with microscopic scales, a characteristic unique to this insect group. In Galapagos the large, conspicuous Macro-Lepidoptera are best known.

Although Charles Darwin was the first collector of insects in the Islands, he curiously never mentioned any butterflies.

Today the Lepidoptera belong to the best studied group of Galapagos insects and new species continue to be discovered.

For marine species distribution data cited in the CDF Galapagos Checklists refer to the five main bioregions of the archipelago (Far Northern, Northern, Western, South Eastern and the Elithabeth Bay Bioregion). For the terrestrial species the more than 120 islands, islets and small rocks have been aggregated into Islands Groups, thus, for example, the island group "Santa Cruz" includes smaller islands like Santa Fé, Plaza Norte, Plaza Sur, Baltra, Daphne Mayor, Daphne Minor, and others.

Please be aware that the distribution data presented here is automatically generated from specimen records and does not always accurately reflect the known distribution for all species.

IUCN red-list assessments presented here may deviate from the global IUCN list for the following reasons:

- for well known species groups like vascular plants or vertebrates updates proposed to the IUCN are shown instead of the outdated, but currently accepted status;
- for poorly known species groups (e.g., lichenized fungi) a general assessment is currently not possible and the list presented here is a regional red-list list for Galapagos archipelago.
