This checklist is automatically generated using Version 3.0 of the online database CDF Galapagos Species Checklist.

**Thrips** are tiny, slender insects with fringed wings. They feed on a large variety of both plants and animals by puncturing them and sucking their contents. Many are considered pests because they feed on plants with commercial value. Others feed on insects or mites and are therefore often considered beneficial. Still others feed on fungal spores or pollen. Around 5,000 species have thus far been described. They are generally tiny insects (In a 1967 survey of Galapagos thrips, three families, six genera, and eight species were recorded. Fifty species are currently known, of which 33 are described and nameable here. The Aeolothripidae is represented by one predaceous species; Merothripidae with one fungivorous species; Thripidae with 18 phytophagous species and 3 predaceous species; and the Phlaeothripidae with seven known phytophagous species and 19 species that feed on fungal hyphae or spores, on break-down products associated with fungal infestations, or prey on other insects.

For marine species distribution data cited in the CDF Galapagos Checklists refer to the five main bioregions of the archipelago (Far Northern, Northern, Western, South Eastern and the Elithabeth Bay Bioregion). For the terrestrial species the more than 120 islands, islets and small rocks have been aggregated into Islands Groups, thus, for example, the island group "Santa Cruz" includes smaller islands like Santa Fé, Plaza Norte, Plaza Sur, Baltra, Daphne Mayor, Daphne Minor, and others.

Please be aware that the distribution data presented here is automatically generated from specimen records and does not always accurately reflect the known distribution for all species.

IUCN red-list assessments presented here may deviate from the global IUCN list for the following reasons:

- for well known species groups like vascular plants or vertebrates updates proposed to the IUCN are shown instead of the outdated, but currently accepted status;
- for poorly known species groups (e.g., lichenized fungi) a general assessment is currently not possible and the list presented here is a regional red-list list for Galapagos archipelago.
