Abstract

This Checklist of Galapagos Mushrooms: Gill fungi, pore fungi, stinkhorns, coral fungi, puffballs, bird's nests, jelly fungi, rusts & smuts includes a total of all 214 taxa reported from the Galapagos Islands.

For each name, detailed information is provided: its Galapagos distribution in islands groups or bioregions generated from the specimen records, comments about the taxonomy (especially synonyms), the origin (native and introduced), taxon status (accepted vs. rejected records) and relevant literature references.

Introduction

This publication lists all species of Galapagos Mushrooms: Gill fungi, pore fungi, stinkhorns, coral fungi, puffballs, bird's nests, jelly fungi, rusts & smuts currently known.

Basidiomycetes are fungi that reproduce by forming spores via specialized club-shaped end cells called basidia. Well known macro-fungi (mushrooms, puffballs, stinkhorns, bracket fungi, jelly fungi, boletes, and chanterelles) belong to this group of organisms, other less known basidiomycetes are smuts and rusts. Very few basidiomycetes form lichens.

This checklist of known basidiomycetes from the Galapagos Islands is currently based on the sparse literature records available and a few recent field surveys on the central island of Santa Cruz. These few records are by no means comprehensive and it is estimated that the current list represents less than 80% of the diversity of Galapagos Basidiomycota.

Methods

This checklist of all known Galapagos Mushrooms: Gill fungi, pore fungi, stinkhorns, coral fungi, puffballs, bird's nests, jelly fungi, rusts & smuts is automatically generated using the online database of the Charles Darwin Foundation Galapagos Species Checklist.

All CDF Galapagos Species Checklists represent the synthesis of many different records: literature citations, data from previously unpublished reports (grey literature), specimen records of natural history collections located in Galapagos and all over the world. To the best of their knowledge authors of the individual checklists revised all available data. When new information becomes available,

the taxonomy of a group changes or new species are discovered, the CDF online database and thus this publication becomes updated.

For many poorly known species groups the higher taxonomic classification still regularly changes according to how our knowledge about species being related changes. In many well known groups the phylogeny is somewhat stable, but to avoid confusion, in particular for groups where taxonomic changes are frequent, all checklists presented here are sorted alphabetical according to genus name and specific epithet. Please refer to the website for the currently accepted taxonomic hierarchy of each group.

Please be aware that the distribution presented here is automatically generated from specimen records and does not always accurately reflect the known distribution for all species.

For marine species, the distribution generally refers to the five main bioregions of the archipelago (Far Northern, Northern, Western, South Eastern and the Elisabeth Bay Bioregion). For the terrestrial species more than 120 islands, islets and small rocks have been aggregated into Islands Groups, thus, for example, the island group "Santa Cruz" includes smaller islands like Santa Fé, Plaza Norte, Plaza Sur, Baltra, Daphne Mayor, Daphne Minor, and others.

IUCN red-list assessments presented here may deviate from the global IUCN list for the following reasons:

- for well known species groups like vascular plants or vertebrates updates proposed to the IUCN are shown instead of the outdated, but currently accepted status;
- for poorly known species groups (e.g., lichenized fungi) a general assessment is currently not possible and the list presented here is a regional red-list list for Galapagos archipelago.

Numbers of the species included in this list are auto-generated. Adding up the number of species in each category will not always equal the total number indicated. Some species have insufficient data to be categorized while others (e.g., category eradicated) will not be included in the total.
