### Abstract

This Checklist of Galapagos Flowering Plants includes a total of all 1547 taxa reported from the Galapagos Islands.

For each name, detailed information is provided: its Galapagos distribution in islands groups or bioregions generated from the specimen records, comments about the taxonomy (especially synonyms), the origin (native and introduced), taxon status (accepted vs. rejected records) and relevant literature references.

### Introduction

This publication lists all species of Galapagos Flowering Plants currently known.

**Magnoliophyta** are also called angiosperms or flowering plants. They can be distinguished from other seed plants because of their flowers composed of sepals, petals, stamens, and carpels.

Angiosperms can be divided into the following general groups:

- **Primitive angiosperms** include families such as the *Nymphaeaceae*, *Magnoliaceae*, *Annonaceae*, *Piperaceae*, *Lauraceae*, *Aristolochiaceae*.
- **Monocots** are characterized by an embryo with only one cotyledon, a pollen grain opening with a single pore, leaves with parallel venation, and vascular bundles irregularly dispersed throughout the stem. The majority have flowers organized in sets of three.
- **Eudicots or true dicots** have an embryo with two cotyledons, a pollen grain with three pores, leaves with reticulate venation, and vascular bundles organized within rings in their stem. The majority have flowers organized in sets of five.

The angiosperms include approximately 257,000 extant species, which represents almost 90% of all known terrestrial plants.

This group encompasses an enormous morphological diversity (e.g., herbs, shrubs, trees, vines), they occupy almost all ecological niches in terrestrial environments, quite a few species are also well adapted to aquatic ecosystems. Their highest diversity is found in the humid tropics, where they dominate the landscape.

Many species of angiosperms are economically very important as they represent the major part of foods consumed by humans, and are used in many plant-derived products.

### Methods

This checklist of all known Galapagos Flowering Plants is automatically generated using the online database of the Charles Darwin Foundation Galapagos Species Checklist.

All CDF Galapagos Species Checklists represent the synthesis of many different records: literature citations, data from previously unpublished reports (grey literature), specimen records of natural history collections located in Galapagos and all over the world. To the best of their knowledge authors of the individual checklists revised all available data. When new information becomes available, the taxonomy of a group changes or new species are discovered, the CDF online database and thus this publication becomes updated.

For many poorly known species groups the higher taxonomic classification still regularly changes according to how our knowledge about species being related changes. In many well known groups the phylogeny is somewhat stable, but to avoid confusion, in particular for groups where taxonomic changes are frequent, all checklists presented here are sorted alphabetical according to genus name and specific epithet. Please refer to the website for the currently accepted taxonomic hierarchy of each group.

Please be aware that the distribution presented here is automatically generated from specimen records and does not always accurately reflect the known distribution for all species.

For marine species, the distribution generally refers to the five main bioregions of the archipelago (Far Northern, Northern, Western, South Eastern and the Elisabeth Bay Bioregion). For the terrestrial species more than 120 islands, islets and small rocks have been aggregated into Islands Groups, thus, for example, the island group "Santa Cruz" includes smaller islands like Santa Fé, Plaza Norte, Plaza Sur, Baltra, Daphne Mayor, Daphne Minor, and others.

IUCN red-list assessments presented here may deviate from the global IUCN list for the following reasons:

- for well known species groups like vascular plants or vertebrates updates proposed to the IUCN are shown instead of the outdated, but currently accepted status;
- for poorly known species groups (e.g., lichenized fungi) a general assessment is currently not possible and the list presented here is a regional red-list list for Galapagos archipelago.

Numbers of the species included in this list are auto-generated. Adding up the number of species in each category will not always equal the total number indicated. Some species have insufficient data to be categorized while others (e.g., category eradicated) will not be included in the total.

However, Royal Botanic Gardens, Kew & Missouri Botanical Garden (2010) treats the two names as referring to separate taxa: *B. dichotoma* Cass. is accepted, whereas *B. dichotoma* (Murray) Stewart is treated as a synonym of *B. rhomboidea* Cass.

Erroneously reported by Stewart (1911); likely misidentification of *Uniola pittieri* Hack, fide Wiggins & Porter (1971).

According to Wiggins & Porter (1971, p. 563) "A second species, commonly referred to as *Brassica* was reported by Andersson under the name *Sinapis arvensis* L. (=*Brassica sinapistrum*). We have not seen specimens of this species from the Galápagos Islands, and it seems possible that the material is referable to *B. campestris*. There is no reason why a second weedy species should not be on the islands, but it should have been re-collected by now if it is actually growing there." The Charles Darwin Foundation Galapagos Species Checklist is a continuously updated list of all species currently known from the Galapagos Islands and reflects up-to-date knowledge compiled by scientists of the Charles Darwin Foundation (CDF) in collaboration with experts from around the world. CDF shares this data publicly and invites comments, corrections and additions.

Please do not hesitate to contact us; your input is very welcome. However, please understand that additions, changes, and corrections will be posted at periodic intervals after thorough cross-referencing of all new data. As an independent international scientific organization, the Charles Darwin Foundation relies on funding from donors who support our work. Please contact us at [datazone@fcdarwin.org.ec](mailto:datazone@fcdarwin.org.ec) if you would like to support the Charles Darwin Foundation Galapagos Species Checklist and help make knowledge of Galapagos biodiversity more widely available.
