

CDF Checklist of Galapagos Butterflies and Moths

Lázaro Roque-Álbelo, Bernard Landry

Last updated: 09 Jan 2018

Abstract

This Checklist of Galapagos Butterflies and Moths includes a total of all 358 taxa reported from the Galapagos Islands.

For each name, detailed information is provided: its Galapagos distribution in islands groups or bioregions generated from the specimen records, comments about the taxonomy (especially synonyms), the origin (native and introduced), taxon status (accepted vs. rejected records) and relevant literature references.

Introduction

This publication lists all species of Galapagos Butterflies and Moths currently known.

The **Lepidoptera** include two large groups of insects: moths and butterflies. They are undoubtedly one of the most popular insect orders, especially the large and colorful butterflies.

Many species are of economic interest, a famous example is the silk moth. Its larvae feed on mulberry leaves and build cocoons of some of the finest fibre known to man.

Lepidoptera are important pollinators, with many night blooming flowers requiring pollination by moths

All Lepidoptera have a body and wings covered with microscopic scales, a characteristic unique to this insect group.

In Galapagos the large, conspicuous Macro-Lepidoptera are best known.

Although Charles Darwin was the first collector of insects in the Islands, he curiously never mentioned any butterflies.

Today the Lepidoptera belong to the best studied group of Galapagos insects and new species continue to be discovered.

Methods

This checklist of all known Galapagos Butterflies and Moths is automatically generated using the online database of the Charles Darwin Foundation Galapagos Species Checklist.

All CDF Galapagos Species Checklists represent the synthesis of many different records: literature citations, data from previously unpublished reports (grey literature), specimen records of natural history collections located in Galapagos and all over the world. To the best of their knowledge authors of the individual checklists revised all available data. When new information becomes available, the taxonomy of a group changes or new species are discovered, the CDF online database and thus this publication becomes updated.

For many poorly known species groups the higher taxonomic classification still regularly changes according to how our knowledge about species being related changes. In many well known groups the phylogeny is somewhat stable, but to avoid confusion, in

particular for groups where taxonomic changes are frequent, all checklists presented here are sorted alphabetical according to genus name and specific epithet. Please refer to the website for the currently accepted taxonomic hierarchy of each group.

Please be aware that the distribution presented here is automatically generated from specimen records and does not always accurately reflect the known distribution for all species.

For marine species, the distribution generally refers to the five main bioregions of the archipelago (Far Northern, Northern, Western, South Eastern and the Elisabeth Bay Bioregion). For the terrestrial species more than 120 islands, islets and small rocks have been aggregated into Islands Groups, thus, for example, the island group "Santa Cruz" includes smaller islands like Santa Fé, Plaza Norte, Plaza Sur, Baltra, Daphne Mayor, Daphne Minor, and others.

IUCN red-list assessments presented here may deviate from the global IUCN list for the following reasons:

- for well known species groups like vascular plants or vertebrates updates proposed to the IUCN are shown instead of the outdated, but currently accepted status;
- for poorly known species groups (e.g., lichenized fungi) a general assessment is currently not possible and the list presented here is a regional red-list list for Galapagos archipelago.

Numbers of the species included in this list are auto-generated. Adding up the number of species in each category will not always equal the total number indicated. Some species have insufficient data to be categorized while others (e.g., category eradicated) will not be included in the total.
